RESULT 14
A57013
early endosome antigen 1 - human
N;Alternate names: endosome-associated protein
C;Species: Homo sapiens (man)
C;Species: Totaliaghan J.M.; Steele-Mortimer, O.; Stenmark, H.; Parton, R.G.; Campbel
J; Biol. Chem. 270, 1353-13511, 1995
A;Title: ERAL, an early endosome-associated protein. EEAl is a conserved alpha-helica
A;Reference number: A57013
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Residues: 1-1410 - REBS
A;Cross-references: GB:L440157; NID:g1016367; PIDN:AAA79121.1; PID:g1016368
A;Residues: 1-1410 - REBS
A;Residues: 1-254, C',256-257, LQ',260-276, A',278-283, A',285-519, D',521-574, EQ',5
A;Residues: ERBL:X789998; NID:g475933; PIDN:CAA55632.1; PID:g475934
A;Accession: S73693
A;Status: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Molecule type: DNA
A;Residues: 1-1033 <HIM>
A;Cross-references: EMBL:AE000035; GB:U00089; NID:g1674044; PIDN:AAB96015.1; PID:g167
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, November 1996

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBFRAGENT ($2).

DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28 RESIDUR REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA HELICAL COLLED COLLS.

CHARACTERISTIC FOR ALPHA HELICAL COLLED COLLS.

PTM: PHOSPHORYLATION INHIBITS THICK FILAMENT FORMATION AND REDUCES THE ACTIN ACTIVATY OF ACTIVITY.

MISCELLANEOUS: DICTYOSTELIUM MYOSIN II HAS NO K(2)EDTA ATPASE ACTIVITY, PERHAPS CORRELATED WITH THE ABSENCE OF A CYS AT THE SH-1 POSITION (688).

SIMILARITY: THE GLOBULAR HEAD AS SEQUENCE SHOWS A HIGH DEGREE OF SIMILARITY WITH THE GLOBULAR HEAD SEQUENCES OF MUSCLE & NONMUSCLE SIMILARITY WITH THE GLOBULAR HEAD SEQUENCES OF MUSCLE & NONMUSCLE HEAVY CHAINS. BY COWTRAST THE ROD SEQUENCE IS LESS CONSERVED, BUT THE PERIODICTITIES OF HYDROPHOBIC & CHARGED RESIDUES, WHICH DICTATE

Submitted (DEC-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: ACTIVATES UBIQUITIN BY FTRST ADENTAATING WITH ATP ITS
CARBOXY-TERMINAL GLYCINE RESIDUE AND THEREAFTER LINKING THIS
RESIDUE TO THE SIDE CHAIN OF A CYSTEINE RESIDUE IN E1, YIELDING
AN UBIQUITIN-E1 THIOLESTER AND FREE AMP.
-!- SATHWAY: FIRST STEP IN UBIQUITIN CONJUGATION.
-!- SUBUNIT: MONOMER (BY SIMILARITY).
-!- SUBUNIT: TO E1 IN OTHER SPECIES.
                                                                                                                                                                                                                       ;

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation - the European Bioinformatics Institute. There are no restrictions on its
                                             SCI. Am. 264:32-39(1991).
-1- FUNCTION: THIS PROTEIN IS ONE OF THE DIFFERENT ANTIGENIC SEROTYPES
OF PROTEIN M. PROTEIN M. IS CLOSELY ASSOCIATED WITH VIRULENCE OF
THE BACTERIUM AND CAN RENDER THE ORGANISM RESISTANT TO
"Neural vector. Herpes may open the way to gene therapy in neurons.";
                                                                                                                                                                                                                                                                                                                           SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. CELL WALL. SIMILARITY: TO OTHER M PROTEINS. SIMILARITY: TO OTHER STREPTOCOCCAL AND STAPHYLOCOCCAL PROTEINS IN THE REGION OF THE MEMBRANE ANCHOR.
```

```
-1- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
-1- MISCELLANEOUS: EACH MYOSIN HEAVY CAMIN CAM BE SPLIT INTO 1 LIGHT MEROMYOSIN (LAM) AND 1 HEAVY MEROMYOSIN (HAM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pfam; PF01576; Myosin_tail; 1.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SEQUENCE FROM N.A.

Muller K., Tidona C.A., Bahr U., Darai G.;

"The DNA sequence of Chilo iridescent virus between the genome coordinates 0.974 and 0.101";

Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.

-! CATALYTIC ACTIVITY: N DECXYNUCLEOSIDE TRIPHOSPHATE = N PYROPHOSPHATE + DNAM(N) (BY SIMILARITY).

-! SIMILARITY: BELONGS TO DNA POLYMERASE TYPE-B FAMILY.

New nucleic acid containing regulator and LHP gene of Mycobacterium tuberculosis - useful in vaccines, for diagnosis, and for expression of heterologous proteins

~

```
The present invention is directed to a polynucleotide carrying the regulatory expressions signals of the ESAT-6 protein as well as an open regulatory expression signals of the ESAT-6 protein as well as an open cading fram ecoding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the M. tuberculosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacteria or their fragments, specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antibodies. The regulatory region present in the polynucleotide may be used to express almost any heterologous protein in mycobacteria, particularly as a fusion with polyhistidine. The two provide a synergistic increase in ability to induce a protective immune the polynucleotide. LHP and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune the polynucleotide may be used to express almost and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune the polynucleotide may be used to expense and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune the polynucleotide may be used to expense the polynucleotide may be used to expense the polynucleotide may be used to expense the polynucleotide with the polynucleotide may be used to expense the polynucleotide may be used to expen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New immunogenic polypeptide(s) from Mycobacterium tuberculosis - are useful in vaccines for prevention or treatment of tuberculosis, also

immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, Tb38-1 Peptide 3. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins proteins pare. SSAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or prevention).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tuberculosis; immunogenic; soluble; antigen; protective immunity; TB; vaccine; pharmaceutical; infection; diagnosis.

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TD38-IP3. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New immunogenic polypeptide(s) from Mycobacterium tuberculosis - are useful in vaccines for prevention or treatment of tuberculosis, also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW32386;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T. B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAX19249 to AAX19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention.

This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                         Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This polypeptide comprises Mycobacterium tuberculosis antigen 1878-187. A DNA molecule (see AAV4400) coding for Tb33-1F3 was isolated from a M. tuberculosis strain H37Rv genomic library. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM64291-R664379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tuberculosis; infection; diagnosis; antigen; Tb38-1F3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DC, Houghton R, Lodes MJ;

                                                                                                                                                                                                                                                                                                                                                                 modifications). The present sequence represents a M.tuberculosis antigen, Tb38-1F3. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's. DNas encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T. B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAX39083 to
                                                                                                                                                                                                                               Gaps
             expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             are used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel recombinant antigens and their encodin nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Antigen;

```
immunogenic part of a folule Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents an tuberculosis antigen, TD38-1. The immunogenic polypeptide can be used to diagnose antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tuberculosis; immunogenic; soluble; antigen; protective immunity; TB; vaccine; pharmaceutical; infection; diagnosis.
                                                                                                                                                                                                                                                                                 New immunogenic polypeptide(s) from soluble M. tuberculosis antigens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, Tb38-1. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

New fusion proteins useful for diagnosis, prevention and treatment of tuberculosis \cdot
                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the Mycobacterium tuberculosis antigen Tb38-1. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens such as Tb38-1, e.g. TbF-2 (see AAY32063) and a Tb99-Tb38-1 fusion. The new fusion proteins are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tuberculosis; antigen; fusion protein; Tb38-1; diagnosis; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                   This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is an antigenic portion of Mycobacterium tuberculosis antigen TD38-1. A DNA sequence (see AAV44384) coding for antigen TD38-1 was isolated from a M. tuberculosis strain H37Rv expression library using sera from patients having pulmonary or pleural tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen,
                                                      Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 54, Application US/083178448

Patent No. 598984

Patent No. 598984

Patent No. 5989894

APPLICANT: Lewis, Randolph V.

APPLICANT: Lewis, Randolph V.

APPLICANT: Ku, Ming

APPLICANT: Hinman, Michael B.

TITLE OF INVENTION: ISOLATED DNA CODING FOR SPIDER SILK

TITLE OF INVENTION: PROTEIN, A REPLICABLE VECTOR AND A TRANSFORMED CELL

TITLE OF INVENTION: CONTAINING THE ISOLATED DNA, AND PRODUCTS THEREOF

NUMBER OF SEQUENCES: 62

CORRESPONDENCE ADDRESS:

ADDRESSEE: Birch, Stewart, Kolasch & Birch

                    TITLE OF INVENTION: ISOLATED DNA CODING FOR SPIDER SILK
TITLE OF INVENTION: PROTEIN, A REPLICABLE VECTOR AND A TRANSFORMED CELL
TITLE OF INVENTION: CONTAINING THE ISOLATED DNA, AND PRODUCTS THEREOF
NUMBER OF SEQUENCES: 69
CORRESPONDENCE ADDRESS:
ADDRESSEE: Birch, Stewart, Kolasch & Birch
STREET: 301 No. 5728810th Washington Street
STREET: Virginia

Sequence 2, Application US/08425069
Fatent No. 5728810
GENERAL INFORMATION:
APPLICANT: Lewis, Randolph V.
APPLICANT: Human, Michael B.
TITLE OF INVENTION: FOOTEIN, A REPLICABLE VECTOR AND A TRANSFORMED CELL
TITLE OF INVENTION: CONTAINING THE ISOLATED DNA, AND PRODUCTS THEREOF
NUMBER OF SEQUENCES: 69
CORRESPONDENCE ADDRESS:
ADDRESSES: Birch, Stewart, Kolasch & Birch
STREET: 301 No. 5728810th Washington Street
STREET: Virginia
                                                                                                                                                                                                                                            Gaps

CBP/P300-INTERACTING TRANSACTIVATOR 1 (MELANOCYTE-SPECIFIC PROTEIN 1).
                                                                                                                                                                                                                                                                                     MEDLINE-9707236; PubMed-8901575; Shioda T., Fenner M.H., Isselbacher K.J.; Shioda T., Fenner M.H., Isselbacher K.J.; Shioda T., Fenner M.H., Isselbacher K.J.; a novel melanocyte-specific gene, encodes a nuclear protein and is associated with pigmentation."; Proc. Natl. Acad. Sci. U.S.A. 93:12298-12303(1996).
-!- FUNCTION: NOT KNOWN, SEEMS TO BE ASSOCIATED WITH PIGMENTATION.
-!- SUBCELLULAR LOCATION: UNCLEAR.
-!- TISSUE SPECIFICITY: EXPRESSED ONLY IN MELANOCYTES AND TESTIS.
EXPRESSED AT HIGH LEVELS IN THE STRONGLY PIGMENTED MELANOMA CELLS BUT AT LOW LEVELS IN THE WEAKLY PICHARITY: BELONGS TO THE CITED FAMILY.
